## DO NOT BEGIN UNTIL YOU ARE INSTRUCTED TO DO SO

This section of the competition consists of eight problems, which will be presented in pairs. Work on one pair of problems will be completed and answers will be collected before the next pair is distributed. The time limit for each pair of problems is six minutes. The first pair of problems is on the other side of this sheet. When told to do so, turn the page over and begin working. Record only final answers in the designated blanks on the problem sheet. All answers must be complete, legible, and simplified to lowest terms. This round assumes the use of calculators, and calculations may also be done on scratch paper, but no other aids are allowed. If you complete the problems before time is called, use the time remaining to check your answers.

1) How many arithmetic sequences have the property that the first term 1) is 1337 , the common difference is -7 , and the sum of the terms in the sequence is 3990 ?
2) John hits either 2,3 , or 4 on his calculator, then either + or $\times$, then 2) either 2,3 , or 4 , then either + or $\times$, then either 2,3 , or 4 , and then presses "enter." If the calculator follows the order of operations, how many distinct values can the end result be? For example, $2+3 \times 4$ gives 14 .

3) How many positive integers less than 1000 can be written as the 3) sum of at least two distinct perfect numbers?
4) Let $a_{0}, a_{1}, a_{2}, \ldots$ be a sequence such that $a_{0}=1$ and $a_{n}=2 a_{n-1}+1$. 4)

Find the remainder when $a_{0}+a_{1}+a_{2}+\cdots+a_{12}$ is divided by 1000 .

5) Consider the sequence $k_{1}, k_{2}, k_{3}, \ldots$ defined such that
6) 

$$
k_{1}=2
$$

$$
k_{n}=k_{1} k_{2} k_{3} \ldots k_{n-1}+1
$$

The first term that is not prime ends up factoring into the product of two distinct primes. Find their sum.
6) Joe buys his ice cream in a right cylindrical cup. The cup has a radius 6) of 5 cm and a height of 6 cm . Joe's cup was full when Jimmy came by and decided he wanted some ice cream too. Jimmy buys his ice cream in a right circular cone. All cones at the place where he buys his ice cream have a radius of 4 cm , but he can choose the height. The ice cream fills up the whole cone and then there's a hemispherical section at the top with the same radius as the cone. If Jimmy wants the same amount of ice cream as Joe, what height of the cone should he choose? Express your answer as a decimal rounded to the nearest thousandth.

7) Find the remainder when the sum of the divisors of 360 is divided by 100 .
8) Let $A B C$ be a triangle and let $D, E$, and $F$ be points inside the triangle
9) such that $D$ lies on $C F, E$ lies on $A D$, and $F$ lies on $B E$. Furthermore, $A E: E D=7: 3, B F: F E=5: 2$, and $C D: D F=9: 4$. If the area of the shaded region is 391 , find the area of $A B C$.
